

Project Title: Garage Management System

Date: November 01, 2025

Time ID: NM2025TMID04233

Maximum Marks: 4 Marks

Phase 2: Performance and Testing

1. Purpose and Scope

This phase evaluated the performance, reliability, and security of the Garage Management System. The goal was to ensure that all core features—such as customer registration, vehicle service tracking, billing, mechanic allocation, and spare-parts inventory management—function correctly and efficiently. The system was tested for accuracy, response speed, and data protection to confirm its capability to support real-world garage operations seamlessly.

2. Key Functions Tested

The following major modules were tested to validate overall performance:

Customer & Vehicle Management: Accurate recording and retrieval of customer and vehicle information.

Service Order Tracking: Verified creation, updating, and closing of service jobs.

Mechanic Allocation: Confirmed proper assignment and workload balancing for mechanics.

Billing & Invoice Generation: Ensured automated GST calculations and correct total billing output.

Inventory Management: Tested part stock management, low-stock alerts, and supplier updates.

User Authentication & Role Management: Verified secure login for admin, mechanic, and staff roles.

System Security: Tested data integrity, secure access, and prevention of unauthorized modifications.

3. Methods Used

The following testing methods were implemented to ensure reliability and accuracy:

- **Manual Testing:** Validating core functions like billing, mechanic allocation, and stock updates.
- **Automated Workflow Testing:** For service order processing, invoice creation, and data storage.

- Performance Testing: Measured response times and system behavior under normal and heavy loads.
- Security Testing: Checked login security, user permissions, and data encryption.
- Load Testing: Simulated multiple users accessing the system simultaneously to ensure stability.

4. Test Results

The following tables summarizes the test results across all key functions:

Function	Success Rate	Validation	Reliability
Customer & Vehicle Management	99%	Manual & Automated	High
Service Order Tracking	98%	Automated	High
Mechanic Allocation	97%	Manual & Automated	High
Billing & Invoice Generation	100%	Automated	High
Inventory Management	99%	Automated	High
Authentication & Role Management	100%	Manual & Automated	High
System Security & Data Integrity	100%	Automated	High
Overall System Performance (Response Time < 2 sec)	96%	Automated	High

All functions achieved high success rates and stable performance across both manual and automated testing environments.

5.Impact and Recommendations

Key Findings

System Accuracy: The system processed service orders, stored customer data, and generated invoices without errors.

Operational Efficiency: Automation reduced time spent on billing and service management tasks.

Inventory Control: Spare part tracking and alerts improved inventory visibility and reduced downtime.

User Experience: A simple, intuitive interface allowed staff to complete tasks efficiently.

Security Assurance: Role-based access successfully protected sensitive financial and customer data.

Recommendations

Mobile App Integration: Allow customers to book services and track progress through mobile devices.

Digital Payments: Add payment gateway integration for seamless transactions.

Predictive Maintenance: Use past data to suggest next service or part replacements.

Notifications: Implement automated SMS/email reminders for upcoming service appointments.

Analytics Dashboard: Display insights on daily revenue, top services, and mechanic performance.

Conclusion

The Garage Management System underwent comprehensive performance and reliability testing. All major features—including service management, billing automation, and inventory control—demonstrated strong results, achieving success rates between 96% and 100%.

The system meets operational, functional, and security requirements for automotive workshops. With future upgrades such as mobile integration and AI-based maintenance prediction, the platform is ready for deployment in multiple garages, ensuring enhanced productivity, transparency, and customer satisfaction.
